Requester's Full Name: Jennifer Marie Examiner #: 70512 Date: 1/25/98
 Art Unit: 36-27 Phone Number 305-2901 Serial Number: 60/146072
 Mail Box and Bldg/Room Location: 70511 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: System - method for monitoring medical records, examining critical care services from remote location
 Inventors (please provide full names): Brian R. Paushter, Jennifer Marie

Earliest Priority Filing Date: 1/18/98

For Sequence Searches Only Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

Search claims 15 & 25.

The gist of this invention is monitoring, ... a monitoring system, more than one ICU from a remote location,

evidence-driven data feed back video monitors that can be selected & zoomed to get specific views of patients

search also via a data server or data warehouse

relational database, database w/ decision support algorithms
examples include claim 20.

knowledge base & AI, litigation & semi-dynamic algorithms.

Telematics and protocols of care in critical care environments.
The paper discusses the potential roles for protocols of care within **critical care** environments from the perspective of providing real-time support for their application. The discussion is based around a conceptual model of care in **critical care** environments. This model has been developed in the wider context of developing information technology systems, to support clinical care in **critical care** environments. The conceptual model of care is a three layer model which demonstrates both the hierarchical and temporal aspects of the care delivered to **patients**. It is proposed that if the value of protocols of care is to be realised in **critical care** environments then they must be seamlessly integrated into the routine data management associated with the care of **patients**. In order to demonstrate this and to evaluate the utility of this concept in the...

... been used as prototype platforms. The application of the concepts developed are described in two **critical care** environments: the anaesthesia department and the **intensive care** unit. Problems in using protocols of care in **intensive care** units suggest that integrating these with a problem solving methodology to create an integrated care plan may be a more appropriate approach to **patient** management.

A telemedicine system for remote cooperative medical imaging diagnosis.
Telemedicine is changing the classical form of health care delivery, by
providing efficient solutions to an...

... professionals located in different clinical sites. This paper presents
the design and development of a telemedicine system for remote
computer-supported cooperative medical imaging diagnosis. The main and
novel component of...

... existing CSCW products, mainly based on centralized architectures, our
distributed toolkit is specially designed for telemedicine applications:
to allow different levels of sharing between participants, to improve user
feedback in highly interactive user interfaces, and to optimize the
required communication bandwidth in order to implement a telemedicine
CSCW application on almost any telecommunication network. This
telemedicine CSCW system has been applied to build a cooperative medical
imaging diagnosis application, in which...

... using cardiac angiography images. The design of the graphical user
interface for this kind of telemedicine CSCW systems, a critical
component which conforms any telemedicine application, is also addressed
with a new methodological approach, to assure the system usability and
final user acceptance. The telemedicine cardiac angiography pilot has
been implemented, tested and evaluated within the Research Project
'FEST-Framework for European Services in Telemedicine' funded by EU AIM
Programme.

Effect of telemedicine on health outcomes in 87 infants requiring neonatal intensive care .

OBJECTIVE: This is an evaluation of a **telemedicine** system for the rapid interpretation of neonatal echocardiograms from a regional, level III neonatal **intensive care** unit (NICU). The use of **telemedicine** to support the cardiology needs of NICUs is increasing. However, there is very little published objective information regarding health outcomes or costs resulting from such **telemedicine** systems. The primary hypothesis tested was that the utilization of a **telemedicine** system for the interpretation of neonatal echocardiograms reduces the **intensive care** length of stay of low birthweight (LBW) infants. STUDY DESIGN: All infants who were admitted to neonatal **intensive care** at New Hanover Regional Medical Center during the first six months of the system were...

... were born in the same period of the previous year. The outcome measures were the **intensive care** length of stay, rate of transfer to academic medical centers, and mortality rate. RESULTS: A statistically non-significant reduction of 5.4 days in the **intensive care** length of stay (LOS) of low birthweight infants was observed ($p = 0.37$). The cost...

The effect of telemedicine on neonatal intensive care unit length of stay in very low birthweight infants.

... study addresses the effect of the installation and use of a telecardiology system on the **intensive care** length of stay of very low birthweight (VLBW) newborn infants. DESIGN: A retrospective comparison of 314 VLBW infants admitted to one of two neonatal **intensive care** units for a three year period from calendar years 1994 through 1996. A regression model was constructed to predict the **intensive care** length of stay while controlling for known risk factors. RESULTS: **Telemedicine**'s effect

Search Report from Ginger D. Roberts

is to reduce the **intensive care** length of stay and it both statistically significant ($p < 0.05$) and practically significant, reducing the **intensive care** length of stay by over 17%. The reduction in length of stay is greater at lower birthweights. CONCLUSIONS: Under the circumstances present in this study, **telemedicine** has been an effective intervention to reduce the **intensive care** length of stay.

Telemedicine - fact or fiction?

HINDU

January 31, 1999

In this article DR. K. GANAPATHY indicates the possible role of telemedicine in the years to come.

WHAT is telemedicine?

Telemedicine is a method, by which patients can be examined, investigated, monitored and treated, with the patient and the doctor located in different places. "Tele" is a Greek word meaning "distance" and "Mederi" is a Latin word meaning, "to heal". Time magazine called Telemedicine "healing by wire". Though often considered "futuristic" and "experimental", telemedicine is today a reality and has come to stay. In telemedicine, one transfers the expertise not the patient.

Hospitals of the future will drain patients from all over the world without geographical limitations. In Cyberia after all, one is a netizen! High quality medical services can be brought to the patient, using telecommunications and information technology, rather than transporting the patient to distant and expensive tertiary care centres. The goal of telemedicine is to eliminate unnecessary travelling of patients and their escorts.

Image acquisition, image storage, image display and processing, and image transport represent the basis of telemedicine. Telemedicine is becoming an integral part of health care services in several countries including the U.K., U.S., Canada, Italy, Germany, Japan, Greece, and Norway.

The simplest application of telemedicine is teleradiology where images are transmitted to remote destinations. Today, there are at least 8000 teleradiology units installed worldwide.

When was modern telemedicine born?

In the Sixties, the National Aeronautics and Space Administration (NASA) played an important part in introducing telemedicine when humans first went into outer space. Devices were developed to monitor the pulse rate, blood pressure etc of the orbiting astronauts. As a concept in the Sixties, it was indeed far ahead of the times. In December 1988, telemedicine was used to provide consultations from medical centres in the U.S., to the earthquake-hit Armenia in the erstwhile USSR. Satellite technology had transcended political, cultural, economic and social barriers to provide medical consultation. It is however only in the last two years that telemedicine has advanced by leaps and bounds.

What is its relevance particularly in a developing country like India?

In Utopia, every citizen has immediate access to the appropriate specialist for medical consultation. In the real world, this cannot even be a dream. It is a fact of life that "all men are equal, but some are more equal than others". We are at present, unable to provide even total primary medical care in the rural areas. Secondary and tertiary medical care is not uniformly available even in the suburban and urban areas. Incentives to entice the specialist to practise in suburban areas have failed. After all professional isolation would lead to mediocrity, which is one step away from entering the Jurassic Park. "Health for All by 2000" may be a slogan even in 2020. Paradoxically, areas most likely to benefit from telemedicine, are those least likely to afford it or have the requisite communication infrastructure. This may no longer be true. In contrast to the bleak scenario in health care, computer literacy is fast developing in the urban and suburban areas. Prices are literally crashing. Health care

Search Report from Ginger D. Roberts

providers in several areas in the world realising this, are now looking at telemedicine as their newly found avatar. Theoretically, it is far easier to set up an excellent telecommunication infrastructure in suburban and rural India than to place thousands of medical specialists in these places. The Indian government has already realised that the future of telecommunication lies in satellite based technology and not in laying thousands of miles of copper terrestrially. To this end, global satellite systems will soon be available. Extending these services to provide health care in remote areas is not as absurd as it may initially appear. To the prophet of doom, telemedicine in India is a non-issue. However, could even the greatest optimist, have anticipated the phenomenal explosion in the use of computers, even in suburban India?

What does telemedicine encompass?

Telemedicine covers a wide range of activities. In the past it was primarily teleradiology - the transferring of high resolution medical images, Xray pictures, ultrasound, CT, MRI pictures, live transmission of ECG's and echocardiograms. Today even a detailed clinical examination can be conducted remotely. Gloves with special sensors are available which give a tactile feedback from a transmitted image. Electronic stethoscopes can transmit sounds from the chest and the heart, from one continent to another, without any alteration in the quality of the sound. Traditionally only the physician at the other end of the stethoscope could hear the sounds. Interpretation was dependent on what was between the two ear pieces! Today the same sounds can be heard through a speaker phone by an unlimited number of doctors in far away places. The sounds can be compared with those in different diseases from a "referral sound laboratory" and the specific problem identified. A wide variety of internal and external examinations can be done with the patient far away - even in outer space or on the moon. Endoscopic cameras peering into the patient's interior can be manipulated from several thousand miles away. Dermascopes can transmit skin lesions in the natural hue (one has a choice of several million colours). Two way interactive communication occurs while a remote examination is being carried out. Detailed analysis and monitoring of patients can be done remotely using sophisticated medical probes and monitors. Access to multimedia patient records, medical databases and treatment algorithms are just a mouse click away.

How does a telemedicine system really work?

A basic telemedicine system consists of a personal computer (with appropriate software), a modem, a telephone line. A scanner and a camera (digital/video) is necessary at the remote end. Standard video conferencing systems transmit images from otoscopes, laryngoscopes (instrument used to see the ear, nose and throat), ophthalmoscopes (to see the retina), laparoscopes (the interior of the abdomen), endoscopes (esophagus, stomach and intestines) and so on. A TV or computer monitor delivers an interactive, full motion, full colour picture of the people at both sites. Audio quality should be excellent. Image quality would depend on the application. Higher quality means more cost. It is essential to know if this increased image quality will alter diagnosis and treatment. ISDN (Integrated Services Digital Network - now available in major cities in India) lines are traditionally used for telemedicine. A leased line or a VSAT (Very Small Aperture Terminal) link can also be used. Actual choice would depend on cost, availability, reliability and necessity. A normal STD line would have limitations but may still suffice.

What are its uses?

Large university teaching hospitals can export their skills to the remote primary centres. Distance becomes immaterial. Other spin offs include access to archived electronic scans and health care records. Health care information (preventive vaccination programmes, information for expectant mothers, information about specific diseases, support groups etc) can be universally available at the touch of a button.

With CT scanners being installed in peripheral hospitals, a national emergency teleconsultation system was introduced in Ireland. This provided

Search Report from Ginger D. Roberts

high quality video transmission of pictures. The speed, quality and completeness of information exchanged resulted in availability of instantaneous emergency tertiary consultation. Recently, the author located in Chennai, carried out a neurological examination of a volunteer based in Toronto.

Fetal telemedicine is now a reality. Pilot projects have shown the efficacy of transmitting fetal ultrasound images from high risk pregnant women. Image quality was sufficient for diagnosis in 97 per cent of cases. There was a significant fall in unnecessary referrals to specialists. Patient satisfaction with the "face to face" video consultation was significantly high. Ultrasound scanners are dime a dozen. Expert ultrasonologists are not. Telemedicine provides a method of bridging the gap.

Tele endoscopy: Today, an expert can peer into the stomach of a patient hundreds or thousands of miles away and make a diagnosis. Present technology enables transmission of high quality images via telecommunication networks at an acceptable cost. Signals from a video camera attached to an endoscope are compressed and digitised by a video codec prior to transmission to remote institution via a 2Mbit/s circuit. The receiver can see the endoscopic examination on a monitor and influence the control and movement of the endoscope by communicating over two-way sound and picture connection with the person operating it.

Telemedical education: Regional, national, international and even intercontinental grand rounds, forming an unbelievable educational medical system, is today a practical proposition. Live two-way interactive transmissions of major surgical procedures from any part of the globe to any metropolitan city in India is now taking place, thanks to VSNL. Recertification of the physician is mandatory in most countries and will soon be in India as well. Interactive Continuing Medical Education programmes are already available where the physician can attend virtual conference, without travelling.

Telepathology: A pathologist using micromanipulators can remotely change the field of view, focus and magnify a slide located under a microscope thousands of miles away. Since the first European meeting on Telepathology in 1992, many such meetings have been held. Several sites have now been interlinked in France, Germany, Spain, Switzerland and other areas in Europe.

Established telemedicine networks

The Arizona International Telemedicine Network linking the U.S. to Mexico was established in 1993. Biopsy specimens are examined as images on a monitor at a remote site, instead of under a microscope. The network includes sites in Arizona, Mexico and China. American Telemedicine International, a subsidiary of Massachusetts General Hospital offers teleradiology facilities to Saudi Arabia, Jordan and Lebanon. Twenty-four hour professional opinions are communicated back to the remote sites. Telemedicine in Japan: There are at least 175 telemedicine programmes operating in Japan. Several links have also been established between hospitals in Japan and the U.S. With favourable government support, a hungry electronics industry and the absence of state licensure restrictions, telemedicine is poised to take great leaps.

What are the advantages of telemedicine?

Worldwide, there is a difficulty in retaining specialists in non-urban areas. The distribution of specialists in the country is indeed lopsided. Chennai has three medical universities. There are more neurologists and neurosurgeons in Chennai, than in all the states of northeastern India put together. The increasing availability of excellent telecommunications infrastructure and video conferencing equipment will help provide a physician where there was none before. Telemedicine can thus avoid unnecessary travel and expense for the patient and his family, improve outcomes and even save lives. Once the "virtual" presence of the specialist is acknowledged, a patient can access resources in a tertiary referral centre without the constraints of distance. Telemedicine allows

Search Report from Ginger D. Roberts

patients to stay at home ensuring much needed family support. In a large project in the U.S. 83 per cent of patients who would have been transferred to an urban hospital remained in their community reducing the cost by at least 40 to 50 per cent. This also ensures maximal utilisation of suburban hospitals. The general practitioner in the rural/ suburban area often feels that he would lose his patient to the city consultant. With telemedicine the community doctor continues to primarily treat the patient under a specialist's umbrella. With modern software/ hardware at either end, 90 per cent of the normal interaction can be accomplished through telemedicine.

What are the legal issues in such a practice?

The fundamental question is "Is the patient electronically transported to it vice-versa? Where does the physician practice? In his house or at the patient's place of residence. Can a doctor in India treat a patient in the U.S. or vice versa? The remote specialist can be deemed to be a consultant to the primary physician who would be signing the charts and taking the primary responsibility. Malpractice suits implicating teleconsultants and telemedicine equipment may be a reality eventually. Liability guidelines will have to take into account the location of the teleconsultant and the patient. Until recently, there were no specific legislations to endorse consultation, diagnosis and treatment using telemedicine. Insurance companies and governments were reluctant to reimburse patients or pay physicians for teleconsultations.

Is offering telemedical consultation practising medicine? Is a consultant who has no direct contact with the patient practicing medicine?

Telemedicine has no doubt made its debut. The launch of the Journal of Telemedicine and Telecare, the establishment of Departments of Telemedicine, the hundreds of articles published, and the number of international conferences on this subject, surely speaks volumes. With a number of high speed communication satellites orbiting the earth, tomorrow's patient and doctor will have access to high speed telecommunication facilities all the time. The Holy Grail of "anytime, anywhere, anyspeed" communication is no longer a myth. (Chennai Telephones notwithstanding) 1700 commercial satellites are scheduled to be launched in the next decade worldwide, compared to the 150 presently in orbit. Telemedicine may result in change in the relationships of health professionals. A nurse in a rural area will carry out instructions given by the teleconsultant from the urban centre. Her status will be considerably higher.

All results will be faxed home. Large volumes of information regarding the hospital, various departments, doctors, lab tests, billing, pre operative, and post operative instructions, follow up etc. will be available on automated audiotext. Using user-friendly menus and a touch telephone a patient can get all the information required from the comfort of his home.

It may be argued that body language is vital in any interpersonal relationship. Today's video conferencing systems are so sophisticated that even four different groups of people can be viewed simultaneously on a giant screen. Minute facial expressions can be discerned with unbelievable clarity. Participants remain in view at all times making it literally a face to face meeting. The spontaneity, naturalness, and interactivity of a conventional person to person meeting are all there - excepting that the patient and doctor are hundreds or even thousands of miles away. Issues can be addressed, multiple opinions can be obtained from all around the globe quickly. High speed networks and multimedia servers allow medical professionals to exchange many types of health care information. Ultimately levels of health care in rural areas will be increased, and costs will be reduced. Preliminary trials with telemedicine have revealed high levels of satisfaction among patients, general practitioners, specialists and the technologists. Pilot projects world wide have evaluated ultimate outcome using telemedicine. It appears that this innovative technology is here to stay. Questions are often raised - and rightly so - whether telemedicine is the result of technology push rather than clinical pull.

Search Report from Ginger D. Roberts

Information technology has changed, is changing, and will continue to change the delivery of health care, worldwide. Humankind is witnessing a growth in technology unprecedented in the annals of history. Previous generations of physicians will find the new concepts of telemedicine unfathomable. To many, it may sound blasphemous. What will happen to the individual doctor-patient relationship considered sacrosanct for centuries? Is it not sacrilegious and bordering on heresy to treat a patient in another continent without knowing his family and cultural background? Yes, say the diehards. No, say the technology enthusiasts. The truth, as in all great truths, is probably somewhere in between.

Telemedicine has not yet made a significant impact on mainstream medicine. The crystal ball reveals that remote consultation will be commonplace in specialities where images form a major part of the consultation. A non-specialist centre can get a specialist's opinion and a specialist get a second opinion. Radiology, pathology, and ultrasound centres will interact electronically in real time, to obtain images. In specialities like dermatology, accident and emergency medicine, and fetal medicine, concomitant video conferencing will allow the specialist to interact with the primary physician alone or with the patient in addition. Remote face to face video consultation may even be perceived as less threatening and more acceptable in certain situations like psychiatric consultations. Workstations with the necessary software will be a common feature in the homes of specialists. Like most other professionals, the telespecialist of the future will offer advice from the comfort of his home without having to travel long distance to a hospital.

Junior hospital staffs now depend on telephonic advice, which has considerable limitations. Tomorrow, using telemedicine, the senior consultant can evaluate the patient and the investigations from his/her bedroom and take the correct decision. The patient need not wait for the next day's "rounds".

The first generation of telemedicine enthusiasts should not forget that technology should be used as a support of treat patients and not viewed as a goal in itself. The challenge today is not confined to overcoming technological barriers, insurmountable though they may appear. It is true that available technology still has considerable scope for improvement. Rather the challenge is why, where and how, to implement which technology and at what cost. A needs assessment is critical. Due to enormous pressure from powerful vendors, the perceived needs for telemedicine may not conform to the actual needs. The take off problems facing telemedicine is legion. Telemedicine today sounds hep and cool, but the reality may be quite different. The future however promises to be exciting. Time alone will tell whether telemedicine is a "forward step in a backward direction" or to paraphrase Neil Armstrong "one small step for man but one giant leap for mankind."

(This author is a senior consultant neurosurgeon with the Apollo Hospitals, Chennai).

Demands of an Aging Population for Critical Care and Pulmonary Services.(Letter to the Editor)

... **Breslow, Michael**

TEXT:

To the Editor: The Committee on Manpower for Pulmonary and **Critical Care** Societies (COMPACCS) (1) reported that the ... is now. Aggressive care management and advance care planning might greatly reduce patient demand for **critical care** services in particular and for physician services in general. Especially among the very old, services...

...the 22% of days that patients with chronic obstructive pulmonary disease (COPD) spend in the **hospital** 1 to 3 months before death, (2) the workforce estimates might look very different.

Second...

...provides a comprehensive analysis of intensivist workforce requirements. (1) As a society dedicated to the **intensive care** management of surgical patients, we note with interest the conclusion that intensivists were "less likely..."

...postoperative patients and patients with burns" and "more likely to provide care in medical ICUs (**intensive care** units)." The study also found that there were 464 graduates from internal medicine -- based **critical care** training (pulmonary plus internal medicine) programs vs 130 from surgically oriented (anesthesia plus surgery) programs in 1996.

These findings suggest that intensivists have not "penetrated" postoperative **intensive care** to the same extent as they have medical **intensive care**. There are a number of explanations with significant implications. Current reimbursement schedules reward the anesthesiologist and the surgeon considerably more for intraoperative than for postoperative **critical care**, whereas **critical care** reimbursement compares favorably with alternative activities for internists and pulmonologists. Furthermore, surgeons may be less...

Search Report from Ginger D. Roberts

...Based on these factors, we concur with the authors' conclusion that the current proportion of **ICU** patients whose care is managed by intensivists is already inadequate and believe that the data suggest that postoperative patients are particularly underserved. We also believe that the provision of postoperative **critical care** requires unique competencies. We conclude that interventions designed to increase the number of surgically oriented...

...caveats.

First, Lynn contends that increased use of advanced care planning may reduce demand for **ICU** care, especially in the very old. We modeled this scenario explicitly (Table 2 of our...

...use of health care technologies. (1,2)

Second, Lynn speculates that a 50% reduction in **hospital** use (and presumably **ICU** use) in the last 3 months of life for patients with COPD would markedly affect workforce estimates. But the majority of **ICU** admissions for COPD are not at the end of life. (3) Thus, even if such a reduction were possible, the impact on **ICU** demand is likely to be minimal. Furthermore, attempts by managed care organizations to limit potentially ineffective **ICU** care at the end of life have led to relatively modest reductions in **ICU** resource use (4) and possibly increased mortality. (5)

Third, Lynn correctly points out that many...

...aging population.

Finally, our article was not intended as a call for more pulmonary and **critical care** specialists. Rather, it was designed to be an example of a general problem and to...

...with Dr Hanson and colleagues that intensivists do not appear to have "penetrated" the postoperative **ICU** to the same extent as the medical **ICU**. There are several possible reasons, some of which are mentioned by Hanson et al. We...

...did not have adequate power, however, to determine whether this demand differed by type of **ICU**.

Organizational Characteristics of Intensive Care Units Related to Outcomes of Abdominal Aortic Surgery.

... Breslow, Michael J ...

... Rosenfeld, Brian A

ABSTRACT: The way some **intensive care** units are run may have an impact on patient outcome. Researchers analyzed organizational characteristics of 39 **intensive care** units (ICUs) in Maryland and linked this to mortality rates among 2,987 patients who were treated in a Maryland **ICU** after surgery on their abdominal aorta. In- **hospital** mortality rates ranged from zero to 66%. Mortality rates were two to three times lower in ICUs that had an **ICU** doctor who made rounds every day to check on patient care.

Resource use was lower...

... Timothy Evans, MD; John Heffner, MD; Norman Paradis, MD.

Context Morbidity and mortality rates in **intensive care** units (ICUs) vary widely among institutions, but whether **ICU** structure and care processes affect these outcomes is unknown.

Objective To determine whether organizational characteristics...

...clinical and economic outcomes for abdominal aortic surgery patients who typically receive care in an **ICU**.

Design Observational study, with patient data collected retrospectively and **ICU** data collected prospectively.

Setting All Maryland hospitals that performed abdominal aortic surgery from 1994 to 1996.

Patients and Participants We analyzed **hospital** discharge data for patients in nonfederal acute care hospitals in Maryland who had a principal

...

...abdominal aortic surgery from January 1994 through December 1996 (n = 2987). We obtained information about **ICU** organizational characteristics by surveying **ICU** medical directors at the 46 Maryland hospitals that performed abdominal aortic surgery. Thirty-nine (85%) of the **ICU** directors completed this survey.

Main Outcome Measures In- **hospital** mortality and **hospital** and **ICU** length of stay.

Results For patients undergoing abdominal aortic surgery, in- **hospital** mortality varied among hospitals from 0% to 66%. In multivariate analysis adjusted for patient demographics, comorbid disease, severity of illness, **hospital** and surgeon volume, and **hospital** characteristics, not having daily rounds by an **ICU** physician was associated with a 3-fold increase in in- **hospital** mortality (odds ratio (OR), 3.0; 95% confidence interval (CI), 1.9-4.9). Furthermore, not having daily rounds by an **ICU** physician was associated with an increased risk of cardiac arrest (OR, 2.9; 95% CI...).

...OR, 2.0; 95% CI, 1.0-4.1). Not having daily rounds by an **ICU** physician, having an CU nurse-patient ratio of less than 1:2, not having monthly...

...ICUs are related to differences among hospitals in outcomes of abdominal aortic surgery. Clinicians and **hospital** leaders should consider the potential impact of **ICU** organizational characteristics on outcomes of patients having high-risk operations.

MORBIDITY AND MORTALITY rates in **intensive care** units (ICUs) vary

Search Report from Ginger D. Roberts

widely among institutions. (1-3) This variation may be related to differences in **ICU** structure and care processes. (4-9) To assess and improve the quality of care in ICUs, it is necessary to understand how **ICU** structure and care processes are related to clinical and economic outcomes. (10-13) We hypothesize...

...outcomes for patients undergoing high-risk surgical procedures that typically require postoperative care in an **ICU**.

Abdominal aortic surgery is a relatively common procedure that is performed in a variety of acute care hospitals with different **ICU** organizational characteristics. Patients admitted for abdominal aortic surgery routinely require **ICU** admission because of high postoperative morbidity and mortality. (14-16) Patients undergoing abdominal aortic surgery...

...to determine whether differences in organizational characteristics of ICUs were associated with differences in **in-hospital** morbidity and mortality, **hospital** length of stay, and **ICU** days for abdominal aortic surgery patients.

METHODS

Patient Data

Following approval from our institutional review...

...the patient's age, sex, race, nature of admission, operating physician, vital status at discharge, **hospital** length of stay, **ICU** days, and codes from the International Classification of Diseases, Ninth Revision, Clinical Modification (ICD-9)...

...information on all patients aged 30 years or older who were discharged from a Maryland **hospital** between January 1994 and December 1996 with a principal procedure code for abdominal aortic surgery...

...blood vessel (ICD-9-CM code 902). Our study had 3 primary outcome variables: **in-hospital** mortality, **hospital** length of stay, and **ICU** days. We obtained information about complications and comorbid diseases using the secondary diagnosis and procedure...

...ICD-9-CM prior to data abstraction for complications likely to be associated with **in-hospital** mortality; these were coded as dichotomous variables.

We adjusted for comorbid diseases, severity of illness, and **hospital** and surgeon volumes. We selected the Romano-Charison comorbidity index to identify potentially important comorbid the volume of aortic surgery performed by each **hospital** and each surgeon in the database.

ICU Data

We developed a questionnaire to obtain information about organizational characteristics of ICUs that provide care to abdominal aortic surgery patients. To identify specific **ICU** issues that might be relevant to the care of such patients, we used a previously developed questionnaire about **ICU** organization and staffing. (22) The questionnaire used in our study had 32 items that evaluated **ICU** physician staffing, nurse staffing, and care processes. We established content validity by having the instrument reviewed independently by 5 **intensive care** physicians to determine if each question captured the intended domain.

Data Collection

We identified the **ICU** directors at the 46 Maryland hospitals that were recorded in the HSCRC database as having performed abdominal aortic surgery during our target period. For hospitals with more than 1 **ICU**, we identified the director of the **ICU** that cared for abdominal aortic surgery patients. We mailed each **ICU** director a letter explaining our study. One week later we mailed the, and 2 weeks...

Search Report from Ginger D. Roberts

...questionnaire. Six weeks after the initial questionnaire mailing, the principal investigator (P.P.) called the **ICU** directors at nonresponding hospitals and encouraged them to respond. We linked our survey data to HSCRC data, but we excluded the names of hospitals and their **ICU** directors from the combined database used to conduct our analysis. The data abstractor was blinded to the **hospital** name, **ICU** characteristics, and patient outcome.

Statistical Analysis

We performed a descriptive analysis of **ICU** characteristics (TABLE 1), patient characteristics (TABLE 2), patient outcomes (in- **hospital** mortality, **hospital** length of stay, and **ICU** days) and medical and surgical complications and interventions (TABLE 3).

We performed bivariate analysis to...

...regression to evaluate the association between categorical dependent variables and continuous independent variables. We modeled **hospital** and surgeon volume as dichotomous variables, using a Lowess smoothing curve, (23) and defined low...

...were independently related to each outcome variable. In the second stage, we sought to identify **ICU** characteristics that were independently related to each outcome variable after adjusting for differences in patient

...

...risk for an outcome, including the primary Outcome variables and complications, was clustered within a **hospital**, we obtained robust variance estimates and used multilevel modeling to evaluate the data hierarchically (characteristics...

...less than)8 vs (greater than or equal to)8 cases per ye ar), and **hospital** volume ((less than)36 vs (greater than or equal to)36 cases per year). Thresholds for surgeon and **hospital** volume are consistent with previously published Literature. (14)

We used multiple logistic regression to evaluate the relationship between **ICU** and patient characteristics and the categorical outcome variables for in- **hospital** mortality and complications. We used multiple linear regression to evaluate the relationship between **ICU** and patient characteristics and the continuous dependent variables for **hospital** length of stay and **ICU** days. To meet the assumption of normality of the linear regression model, we performed a log transformation on **hospital** length of stay and **ICU** days. We evaluated the effect of the log transformation by using the residual plot, the...

...5.0 software (Stata Corp, College Station, Tex) to perform all calculations.

RESULTS

Patient and **ICU** Characteristics

We received completed questionnaires from the **ICU** directors at 39 (85%) of the 46 hospitals that performed abdominal aortic surgery during the...

...16% for arterial embolism and thrombosis; and 3% for complications of a surgical procedure.

In- **Hospital** Mortality

The in- **hospital** mortality rate varied among hospitals from 0% to 66%. In the bivariate analysis, a number of **ICU** characteristics were associated with increased risk of in- **hospital** mortality after abdominal aortic surgery. Odds ratios (ORs) and 95% confidence intervals (CIs) for these characteristics included not having a full-time **ICU** medical director (OR, 2.1; 95% CI, 1.2-3.5), having less than 50% of **ICU** attendings certified in **critical care** (OR, 2.0; 95% CI, 1.4-3.0), not baying daily rounds by an **ICU** physician (OR, 3.0; 95% CI, 2.1-4.3), and having a decreased **ICU** nurse-patient ratio in the evening (OR, 1.9; 95% CI, 1.2-3.0). The other **ICU** characteristics were not associated with in-

Search Report from Ginger D. Roberts

hospital mortality.

In the multivariate analysis, (TABLE 4), not having daily rounds by an **ICU** physician vs having daily rounds by an **ICU** physician was independently associated with an increased risk of in- **hospital** mortality (OR, 3.0; 95% CI, 1.9-4.9).

Complication Analysis

A number of postoperative complications from our preselected list were independently associated with increased in- **hospital** mortality after abdominal aortic surgery. These included acute myocardial infarction (OR, 10.6; 95% CI...).

...occurrence of these postoperative complications in the abdominal aortic surgery cases.

To explore how an **ICU** characteristic might be related to in- **hospital** mortality, we examined the association between complications and the **ICU** characteristic significantly associated with in- **hospital** mortality in the multivariate analysis. After adjusting for patient characteristics, **hospital**, and surgeon volume, we found that lack of daily rounds by an **ICU** physician was independently associated with an increased risk of cardiac arrest (OR, 2.9; 95...).

...4.1), but was not associated with an increased risk of surgical complications (Table 3).

Hospital Length of Stay

In the bivariate analysis, **ICU** characteristics associated with increased **hospital** length of stay included not having a full-time **ICU** medical director (mean increase, 10%; 95% CI, 4%-16%), having an **ICU** nurse-patient ratio of less than 1:2 during the evening (mean increase, 17%; 95% CI, 1%-35%), not having monthly review of **ICU** morbidity and mortality (mean increase, 18%; 95% CI, 8%-27%), and routinely extubating aortic surgery patients...
...mean increase, 23%; 95% CI, 8%-40%).

In the multivariate analysis, shown in Table 4, **ICU** characteristics independently associated with increased **hospital** length of stay for abdominal aortic surgery cases were having an **ICU** nurse-patient ratio of less than 1:2 in the evening (mean increase, 20%; 95% CI, 7%-33%), not having monthly review of **ICU** morbidity and mortality (mean increase, 15%; 95% CI, 4%-25%), and having aortic surgery patients...

...the operating room (mean increase, 11%; 95% CI, 2%-21%). After adjusting for patient characteristics, **hospital** volume, and surgeon volume, we found that routinely extubating patients in the operating room was...

...2.1) and postoperative pulmonary complications (OR, 1.9; 95% CI, 1.7-2.3).

ICU Days

In the bivariate analysis, the **ICU** characteristics associated with increased **ICU** days included not having daily rounds by an **ICU** physician (mean increase, 65%; 95% CI, 35%-96%), having the surgeon or both the surgeon and **ICU** physician manage the patient vs having the **ICU** physician manage the patient in the **ICU** (mean increase, 39%; 95% CI, 18%-55%), and having an **ICU** nurse-patient ratio of less than 1:2 during the day (mean increase, 29%; 95% CI, 1%-68%).

In the multivariate analysis, as shown in Table 4, the **ICU** characteristics independently associated with increased **ICU** days for abdominal aortic surgery cases included not having daily rounds by an **ICU** physician (mean increase, 83%; 95% CI, 48%-126%), and having an **ICU** nurse-patient ratio of less than 1:2 during the day (mean increase, 49%; 95% CI, 17%-91%).

Hospital and Surgeon Volume

Surgeons who performed fewer than 8 cases per year had a higher mean in **hospital** mortality rate than surgeons who performed 8 or more (10% vs

5%; P = .003). However...

...differences in patient characteristics using multivariate logistic regression, there was no significant difference in in- **hospital** mortality between surgeons who performed fewer than 8 and those who performed 8 or more...

...fewer than 36 cases of abdominal aortic surgery per year had a higher mean in- **hospital** mortality rate than hospitals that had 36 or more cases per year (8% vs 5...

...that hospitals that had fewer than 36 cases per year had a significantly higher in- **hospital** mortality rate than hospitals that had 36 or more. As shown in Table 4, **hospital** volume also was inversely associated with in- **hospital** mortality after adjusting for differences in both **ICU** and patient characteristics.

COMMENT

This study demonstrates that there is significant variation in the outcomes of abdominal aortic surgery patients and significant variation in **ICU** organizational characteristics in Maryland hospitals that perform this relatively common surgery. More importantly, our results indicate that **ICU** organizational characteristics are related to differences in in- **hospital** mortality, **ICU** days, and **hospital** length of stay. Such information may provide direction regarding ways to further improve the outcomes...

...aortic aneurysm patients, especially octogenarians, is good and supports surgery, (27) strategies to reduce in- **hospital** mortality become increasingly important.

Daily rounds by an **ICU** physician were associated with a 3-fold reduction in in- **hospital** mortality for abdominal aortic surgery patients. This finding is consistent with an emerging body of evidence that suggests using full-time **intensive care** physicians can reduce in- **hospital** mortality. (28,29) We found that daily rounds by an **ICU** physician were associated with reduced risk of several specific medical complications and interventions that an...

...affect but were not associated with reduced risk of surgical complications. Daily rounds by an **ICU** physician may be a marker for team care, and this model can be widely applied...

...for detecting differences because they included many patients with a relatively low risk of in- **hospital** mortality and adjusted for differences in risk across patient populations, which may distort the relationship between **ICU** organizational characteristics and outcomes. (1,3,30)

We also found that variation in organizational characteristics...

...with differences in resource use for patients undergoing abdominal aortic surgery in Maryland. A decreased **ICU** nurse-patient ratio during the day or evening was associated with increased **ICU** days and **hospital** length of stay, respectively. In addition, monthly review of **ICU** morbidity and mortality was associated with decreased **hospital** length of stay, while routinely extubating these patients in the operating room was associated with increased **hospital** length of stay. To further explore this relationship, we found that routine extubation was independently...

...complications. These results are consistent with several small studies that showed that the addition of **ICU** specialists decreased **ICU** resource use. (10-13,31)

Daily rounds by an **ICU** physician may be as important as the experience of the surgeon performing a high-risk...

...Although surgeon volume was not significantly related to outcomes after adjusting for patient characteristics, increased **hospital** volume was

Search Report from Ginger D. Roberts

associated with better outcomes for abdominal aortic surgery patients. If the vast majority...

...procedure have sufficient experience, the best way to improve outcomes may be to improve postoperative **ICU** care. It is concerning that **hospital** volume was independently associated with in- **hospital** mortality and 60% (n = 1793) of patients were operated on at low-volume hospitals. This is an area worthy of further study.

A closed **ICU** requires full-time, qualified **critical care** physicians and the commitment from both physicians and administrators to reorganize the **ICU**. We did not attempt to classify ICUs as open vs closed because these terms are...

...coding the types of outcome variables used in this analysis. (34) In this study, the **ICU** data were prospective in that we collected the data, while the patient data were retrospective...

...this potential bias should have been minimized by our keeping the data abstraction blinded to **hospital** name, **ICU** characteristics, and patient of comorbid diseases between hospitals with and without daily rounds by an **ICU** physician. The percentage of patients with chronic renal disease and mild liver disease (complications associated with in- **hospital** mortality) were exactly the same at hospitals with and without daily rounds by an **ICU** physician (4% and 1%, respectively), while prior myocardial infarction was coded more frequently at hospitals without daily rounds by an **ICU** physician and severe diabetes mellitus was coded more frequently at hospitals with daily rounds. Therefore...

...results because coding of comorbid diseases at hospitals with and without daily rounds by an **ICU** physician is not a confounding variable. Additionally, random misclassification of comorbid diseases would bias our

...

...by misclassification of complications. We reviewed a random sample of 25 medical records from 1 **hospital** and found the coding of complications associated with in- **hospital** mortality to be 96% accurate. We helped establish construct validity for the coding of complications by evaluating only complications that were independently associated with in- **hospital** mortality. (35) Additionally, the bias from coding of complications is likely minimal because the association between daily rounds by an **ICU** physician and complications was consistent across several medical complications and interventions that an intensivist would...to account for severity of illness relatively well, as evidenced by their ORs for in- **hospital** mortality. Most patients (91%) had unruptured aneurysms and would be expected to have normal physiology...

...significantly increased.

The third limitation is that we did not adjust for differences in pre- **ICU** care. We were not able to adjust for changes in surgical technique over time; however...

...available during the study. Moreover, there is no known association between surgical approach and in- **hospital** mortality. We were also not able to adjust for the type of anesthesia patients received. However, most of the differences in pre- **ICU** care would affect surgical complications more than medical complications, and we were more interested in the association between **ICU** organization and medical complications.

A fourth limitation is our inability to adjust for differences in post- **ICU** care. However, we did adjust for **hospital** volume and used multilevel modeling that may account for some of the differences in post- **ICU** care. Although the data set used in this study does not provide information about **ICU** mortality, we believed the use of in- **hospital**

Search Report from Ginger D. Roberts

mortality as an outcome would be less biased than ICU mortality because ICU mortality is affected by decisions to discharge patients from the ICU. We did not control for discharge decisions and, thus, cannot associate the location of death...

...in which care was received.

The fifth limitation is the reliability and validity of our ICU survey instrument. We relied on the ICU directors to describe the characteristics of their ICUs. Most questions, including daily rounds by an ICU physician, were derived from a previously validated questionnaire.

(3) Because most ICUs have 1 director...

...We tested the interrater reliability on 2 sets of intensivists (the 2 codirectors of 1 ICU and the director and staff intensivist at another) and found 100% agreement and 97% agreement...

...the questions. Our validity evaluation focused on content validity that we established by having 5 intensive care physicians independently review the instrument. We assumed the responding ICU medical directors would answer accurately, since we preserved hospital confidentiality. The sixth limitation is that the survey was administered at the end of the...

...years for which we had patient data. It is unlikely that hospitals dramatically changed their ICU organization during this period, but if this occurred, we would have been less likely to find an association between ICU organizational characteristics and outcome. The final limitation is that we focused on 1 surgical procedure...

...aortic surgery in Maryland.

Despite these limitations, our study results have significant implications for clinicians, hospital administrators, and policymakers because they point to several aspects of ICU care that potentially could be modified to decrease in-hospital mortality, complications, and length of stay of postoperative care for high-risk patients. The results suggest that decreasing ICU nursing staff below a certain level may lead to increased costs of care and length...

...is needed to determine whether implementation of specific measures, such as daily rounds by an ICU physician, can decrease morbidity and mortality, as well as length of stay, for high-risk...

...are not in place. Meanwhile, patients should consider how ICUs are organized when choosing a hospital in which to have a major surgery.

Detailed Description

Claims

English Abstract

A system and method for providing continuous expert network **critical care** services from a remote location. A plurality of **intensive care** units (**ICU** 's) with associated patient monitoring instrumentation is connected over a network to a command center...

...intensivists 24 hours a day, 7 days a week. The intensivists are prompted to provide **critical care** by a standardized series of guideline algorithms for treating a variety of **critical care** conditions. Intensivists monitor the progress of individual patients at remote **intensive care** units. A smart alarm system provides alarms to the intensivists to alert the intensivists to...

...analyzes individual patient information from a plurality of command centers and provides updated algorithms and **critical care** support to the command centers.

French Abstract

...reseau expert a partir d'un point distant. Une pluralite d'unites de soins intensifs (**ICU**) contenant des appareils de controle de patients associes est reliee par un reseau a un...

Detailed Description

... issue of the PCT Gazette.

I Title: System and Method for Providing Continuous, Expert Network **Critical Care** Services from a Remote Location(s)

BACKGROUND OF THE INVENTION

1. Field of the Invention

This invention relates generally to the care of patients in **Intensive Care** Units (ICUs). More particularly this invention is a system and method for care of the...

...both on-site and remote locations.

2. Background Art

While the severity of illness of **ICU** patients over the past 15 years has increased dramatically, the level of and type of physician coverage in most ICUs has remained constant. Most **ICU** patients receive brief minutes of attention during morning rounds from physicians with limited **critical care** experience. During the remainder of the day and night, nurses are the primary caregivers, with...

...result of this mismatch between severity of illness and physician coverage is an unacceptably high **ICU** mortality rate (10% nationwide), and a high prevalence of avoidable errors that result in clinical...

...supply.

Numerous studies have shown that Intensivists (physicians who have trained and board certified in **Critical Care** Medicine) can markedly improve patient outcomes. However, only one-third of all **ICU** patients ever has an Intensivist involved in their care, and the number of Intensivists would need to increase tenfold (nationally) to provide 24-hour coverage to all **ICU** patients. With the rapid aging of the population, this shortfall of expertise is going to...

...variation contributes to suboptimal outcomes, in both the quality and cost of care delivered to **ICU** patients.

Search Report from Ginger D. Roberts

What is needed is a redesigning of the **critical care** regimen offered to patients in an **ICU**. Rather than the consultative model where a periodic visit takes place and the doctor then...

...technology that leverages the intensivists' expertise and standardizes the care afforded to patients in an **ICU** is required. Further, continuous feedback to improve the practice of intensivists in an **ICU** is necessary to provide the intervention required to minimize adverse events. This invention seeks to...diagnostic tool, none of them provides a comprehensive method for monitoring and providing real time **critical care** at disparate **ICU**'s. In short, they are NOT designed for **critical care**. Further, none of these inventions provide for the care of a full time intensivist backed by appropriate database and decision support assistance in the **intensive care** environment.

What would be useful is a system and method for providing care for the...

...in the care of the critically. Further such a system would standardize the care in **ICU**'s at a high level and reduce the mortality rate of patients being cared for in **ICU**'s

SUMMARY OF THE INVENTION

The present invention provides a core business of Continuous Expert Care Network (CXCN) solution for **hospital intensive care** units (ICUs). This e-solution uses network, database, and decision support technologies to provide 24...

...a stand-alone software application that codifies evidence-based, best practice medicine for 150 common **ICU** clinical scenarios. These support algorithms are explained more fully below.

The "Command Center" model, again...

...way to a more distributed remote management model where Intensivists and other physicians can access **ICU** patients and clinicians (voice, video, data) from their office or home. In this scenario, the present invention will be available in **hospital** applications that centralize **ICU** information, and offer physicians web-based applications that provide them with real-time connectivity to...

...disclosed herein.

The present invention addresses these issues and shortcomings of the existing situation in **intensive care**, and its shortfalls via two major thrusts. First, an integrated video/voice/data network application enables continuous real-time management of **ICU** patients from a remote setting. Second, a client-server database application B integrated to the ...

...It is therefore an object of the present invention to reduce avoidable complications in an **ICU**.

It is a further object of the present invention to reduce unexplained variations in resource utilization in an **ICU**.

It is a further objective of the present invention to mitigate the serious shortage of...

...another objective of the present invention to reduce the occurrence of adverse events in an **ICU**.

Search Report from Ginger D. Roberts

care...

...ICUs.

It is yet another objective of the present invention to reduce the cost of **ICU** care.

It is yet another objective of the present invention to dramatically decrease the mortality in an **ICU**.

It is yet another objective of the present invention to bring information from the **ICU** to the intensivist, rather than bring the intensivist to the **ICU**.

It is a further objective of the present invention to combine tele-medical systems comprising oversee care within the **ICU**.

I I It is a further objective of the present invention to allow intensivists to monitor ICUs from a site remote from each individual **ICU**.

It is a further objective of the present invention to bring organized detailed clinical information to the intensivist, thereby providing standardized care in the **ICU**.

It is yet another objective of the present invention to utilize knowledge-based software to...

...remote location is manned by intensivists 24 hours a day, seven days per week. Each **ICU** comprises a nurse's station, to which data flows from individual beds in the **ICU**. Each patient in the **ICU** is monitored by a video camera, as well as by clinical monitors typical for the **intensive care** unit. These monitors provide constant real time patient information to the nurse's station, which...

...turn provides that information over a dedicated T- I (high bandwidth) line to the **ICU** command center/remote location. As noted earlier, the command center/remote location is remote from the **ICU**, thereby allowing the command center/remote location to simultaneously monitor a number of patients in...

...remote location, video monitors exist so that the intensivist can visually monitor patients within the **ICU**. Further, the intensivist can steer and zoom the video camera near each patient so that...

...close and generally. Audio links allow intensivists to talk to patients and staff at an **ICU** bed location and allow those individuals to converse with the intensivist.

Clinical data is constantly...

...advantage of the present invention is that intensivists see all patients at a plurality of **ICU**'s at all times. Further, there is a continuous proactive intensivist care of all patients within the **ICU**, thereby minimizing adverse events. Intervention is triggered by evidence-based data-driven feedback...

...time, 24-hour a day, seven day a week intensivist care for patients in an **ICU** can be obtained.

Further, more timely interventions in the care of the patients can be...

...complications and adverse events. This in turn will lead to a reduced

Search Report from Ginger D. Roberts

mortality within the **ICU**, and hence, a reduced liability cost due to the dramatic reduction in avoidable errors in health care.

By providing timely interventions, the length of stay within the **ICU** can be greatly reduced, thereby allowing more critically ill patients to be cared for in the **ICU**.

In addition, by reviewing and standardizing the care afforded to patients in an **ICU**, a more standardized practice across a variety of ICUs can be achieved. This will lead to more cost-effective care within the **ICU**, and reduced ancillary cost for the care of the critically ill.

7

I The overall...

...full videoconferencing capability. In addition, computer workstations are dedicated for exclusive physician use in each **ICU**, preferably at the nurse's station.

Intensivists use the workstations to view patient information, consult...

...across the pod.

Updates and changes made to the record are available at both the **ICU** and the command center/remote location for any given patient.

Each command center/remote location contains at least three workstations: one for the intensivist, one for the **critical care** registered nurse, and one for a clerk/administrative person.

The intensivist workstation comprises separate monitors for displaying **ICU** video images of patients and/or **ICU** personnel, output from bedside monitoring equipment, patient clinical data comprising history, notes, lab reports, etc...

...upon request of the intensivist.

Remote patient management is utilized in the present invention's **critical care** program to supplement traditional onsite care. The rationale underlying the remote patient management of the...

...are inherently unstable and require continuous expert care that is not now offered in existing **ICU** monitoring regimens. Further, remote monitoring allows a single intensivist to care for patients in multiple **ICU** locations, thereby creating an efficiency that makes continuous care feasible.

Remote intensivist care of the...

...using the ceiling-mounted cameras in each room.

Command center/remote location personnel communicate with **ICU** staff through videoconferencing and through "hot phones," which are dedicated telephones directly linked between the command center/remote location and the **ICU**. These communications links are used to discuss patient care issues and to communicate when a...There may be multiple records for any given patient, since the patient may visit the **ICU** on more than one occasion. This file contains a record of each visit to an **ICU** by a patient.

Physician-patient task: Contains the task that had been defined for each patient.

Search Report from Ginger D. Roberts

Present illness: This contains a textual description of the patient illness for the specific **ICU** visit.

Physical exam: This contains the information gathered as a result of a physical examination of the patient during the admission to the **ICU**.

3 1 Surgical fluids: This provides all the information related to the fluids provided during...

...pertaining to any surgical procedure performed on a patient while the patient is at the **ICU**.

Patient admit: This provides general information that needs to be gathered when a patient is admitted into the **ICU**.

Medical orders: This provides the general information for all types of medical orders associated with...

...a patient.

Vital sign information is also critical to the administration of care in the **ICU**. A number of different modules collect information relating to patient vital signs. For example.

Patient...

...the general information that needs to be gathered when a patient is admitted to the **ICU**.

Patient visit: This contains a record of each visit to an **ICU** by a patient.

1 8 Patient: Provides demographic information for each patient.

Vital sign header...

...Vital sign: Contains the vital sign data taken at specific intervals for a given patient.

Hospital : This contains identifying information for a particular hospital where the care is given.

ICU bed: Contains the association for identifying which beds are in a given **ICU**.

Command center/remote location definitions and modules have also been created for the present invention...

...patient.

Command center/remote location: Provides identifying information for a particular command center/remote location.

Hospital : Contains identifying information for a particular hospital wherein an **ICU** is located.

ICU : Contains identifying information for an **ICU** at a hospital.

I I **ICU** bed: Contains the association for identifying which beds are in a given hospital .

ICU patient location: Provides the association between an **ICU** and a patient and identifies where a patient is located within an **ICU** in a particular hospital .

The order entry functionality of the present invention provides a critical service for obtaining information on the patient during admission, medical orders, and procedures provided to the patient during the **ICU** stay. For example.

Radiology: Contains all radiology performed on a particular patient.

Radiology results: Contains...

...OF THE INVENTION

The present invention is a system and method for remote monitoring of **ICU**'s from a distant command center/remote location. By monitoring a plurality of **ICU**'s remotely, intensivists can better spread their expertise over more **ICU** beds than heretofore

14

I achievable. The presence of 24-hour a day/7 day-per-week intensivist care dramatically decreases the mortality rates associated with **ICU** care.

Referring to Figures I and IA, the Billing and Demographic data structure of the...the patient ID stored in the demographic information 9010.

Patient's are entered into the **hospital** by a **hospital** representative 9006 who has a representative ID which also is ultimately associated with the patient...

...be associated ultimately with

15

I treatment of the patient.

Each patient admitted to the **hospital** and to the **ICU** has a patient visit ID associated with the patient 9017. This visit ID has patient ID information, **ICU** information, admission date, and other information relevant to the specific visit. This information is illustrated...

...it.

Referring now to Figure 2A, the Command Center logical data structure illustration continues. Each **ICU** bed has an associated location ID which comprises **hospital** **ICU** information, room number, and bed number 9038. In addition, and as described earlier, instrumentation such...
9038. In addition, and as described earlier, instrumentation such...
...particular patient. Therefore the camera setting 9040 will have a location ID relating to the **ICU** bed

16

I as well as have camera value settings and associated camera identifier information.

Each **ICU** bed 9038 is associated with an **ICU** 9032. Each **ICU** has information associated with it that uniquely identifies the **ICU** as being associated with the particular **hospital**, and having particular phone numbers, fax numbers, work space addresses, and other information, that help to identify the **ICU**.

As noted above, each **ICU** is associated with a **hospital** 9034. Each **hospital** has a unique identifier, as well as its own name, address, and other identifying information.

Further, since each **hospital** **ICU** is to be coordinated through a remote command center, information on the remote command center 9036 is associated with the **hospital** information. Each command center has a unique ID and has associated address I I information...

Search Report from Ginger D. Roberts

...9010 is linked to a patient location 9030 which in turn is associated with an **ICU** bed 9038 each of which beds are uniquely associated an **ICU** 9032 which is associated with a **hospital** 9034 which in turn has the **ICU** managed by a command center 9036.

An integral part of the system of the present...ID for the particular patient. This header information comprises a date-time stamp combined with **hospital** information, medical reference numbers, and identification of the patient. Vital sign details 9122 are also...

...are illustrated. For example, a vital sign log header 9120 is created using the unique **hospital**

21

I ID and medical record numbers. Other information such a patient name, and date...

...For example, blood pressure measurements, respiration, and other factors are all detailed for a particular **hospital** ID. It should be noted that all vital sign data is logged in and kept...

...as errors.

Vital sign error details 9126 are also recorded and associated with a particular **hospital**. Information and the vital sign error detail also comprises heart rate, blood pressure, and other...

...associated with a vital sign error I I header 9130 which is associated with the **hospital** identifier and the patient first and last name and other information. Various vital sign error...

...as noted above.

Care Net patient location 9132 is recorded and associated with a particular **hospital** ID and location ID for the particular patient. Carenet is a proprietary product designation of since it identifies the equipment from which measurements come. The **ICU** bed information 9038 is associated with the Care Net patient location 9132.

Referring to Figure...

...distributed architecture comprises a headquarters component 200, a command center/remote location 202, and a **hospital ICU** 204, which, while represented as a single **hospital** in this illustration, in the preferred embodiment comprises several **hospital** ICUs at different locations. The headquarters unit 200 comprises a database server and data warehouse...

...of a statistical nature that will assist clinicians and intensivists in treating patients in the **ICU**. The headquarters' function also serves to allow centralized creation of decision support algorithms and a...

...at the command center/remote location once all systems are up and running.

At the **hospital ICU** 204, each patient room 232, 234 has a series of bedside monitors and both video and audio monitoring of each patient in the patient room. Each **ICU** further has a nurse's station with a video camera and monitor 230 so that...

...I I those intensivists at the command center/remote location. The monitoring equipment at the **ICU** is served by a monitor server 236, which receives and coordinates the transmission of all bedside monitoring

Search Report from Ginger D. Roberts

and nurses station communication with the command center/remote location. Finally, each **ICU** has a patient information front end 15228, which receives and transmits to...

...and with patients as the need arises. Information from the monitor server 236 at the **hospital ICU** is served to an HL7 (the language for transmitting **hospital /patient/diagnostic data**) gateway 214 to a database server 222. In this fashion, information from...

...center/remote location personnel to monitor the incoming data from the patient rooms in the **ICU**. Information from the patient information front end 228 is provided to an application server 224...

...and assembling information in the database 222 that is associated with individual patients in the **ICU**.

It is expected that there will be a great deal of concurrent **hospital** data that is necessary to the implementation of the present invention. It is therefore expected...

...server and other components are such as routers and switches are commonly used in the **ICU**, the command center/remote location, and the headquarters. For example.

The Cisco 3600 router is...

...the same device. This is necessary, since the various command center/remote locations, headquarters, and **intensive care** units all must integrate and transmit video, audio, and data among the various entities.

The...system 268 monitors the overall health of the network of command center/remote locations and **intensive care** units as well as the functionality of the I I individual pieces of equipment within...

...260 allows for point to point communication over a TI line, with a plurality of **intensive care** units located remotely from the command center/remote location. Hot phones 252 and 254 allow communication with the headquarters and the **intensive care** unit.

Intensive care unit 204 comprises a Cisco 2924 switch 272 for the purpose of interfacing with the...

...the workstation 280 provides for textual advice and patient orders to be delivered to the **intensive care** unit for execution. The **intensive care** unit also comprises a laser printer 284 for the printing of patient orders and other information relevant to the care of **intensive care** patients.

Referring to Figure 1 1, the videoconferencing/surveillance/imaging components of the present invention are illustrated. The **hospital ICU** 204 comprises a series of video cameras 290, which are located in patient rooms and...

...for imaging emanating from the workstation at the command center/remote location 252 through the **ICU** workstation 280 through a multi-port serial controller 286. Video feed from the video cameras...

...care. It is also important that information of an audio nature be fed to the **intensive care** unit, both to the patient rooms and to the nurse's station. To do this...

...from a video codec 304, which in turn is connected to the workstation at

Search Report from Ginger D. Roberts

the **ICU**. As noted earlier, a **I I** scanner 282 is provided, so that information can be...

...to Figure 12 the vital signs data flow is illustrated. The monitoring system at each **ICU** bedside comprises a monitoring system for monitoring the vital signs for the patient. The vital...

...transmits that vital sign data 454 using the HL7 language (the standard processing language for **hospital** data and information). The processor at the **ICU** processes the vital sign data for transmission and storage purposes and transmits that information to...

...only the individual patient but from all of the patients being cared for in the **ICU**. This database warehouse provides the ability to do

26

I data mining for trends that...

...to the remote site, the vital sign data is displayed in real time at the **ICU** 472.

Referring to Figure 13(a) the diagnostic imaging interaction is illustrated. X-rays for...is illustrated. A video conferencing session is established 478 regarding a particular patient in an **ICU** bed.

I I Using the video cameras in each room and/or at the nurses station at the **ICU**, the patient and/or the nurse can be viewed 480. On the other end of...

...the Apache 11 score is less than eight, the patient is triaged to a none **ICU** bed 518 since the patient will not necessarily require **intensive care** thereby saving relatively scarce resources of the **ICU** for those who are truly critically ill.

Referring to Figure 16 the automated coding/billing...600 allows the intensivist to order procedures and medication to assist the patients in the **ICU**. For example, the intensivist can order an ECG 604. Thereafter the order is reviewed and...

...system 610.

Thereafter the data output system prints the order to the printer in the **ICU** 616. For record keeping purposes the order is exported in the HL7 language to the **hospital** data system 618. In addition the data output system adds an item to the data...

...is provided to the data output system 610 where again the orders are printed for **ICU** and 616 and for the **hospital** data system. In this case, any medications that are ordered are then provided to the...

...614 so that the complete list of all medications that are being administered to the **ICU** patient is current.

Referring to Figure 18 the event log is illustrated. The database 620...

...manner of notes and data relating to the particular patient that is admitted to the **ICU**. For example, admission notes 622 are taken upon admission of the patient and stored in...

...specific to that patient. Progress notes 624 are created during the patients stay within the **ICU** to note the progress the patient is making giving the various treatments.

Procedural notes 626...

...in a single location key clinical information from throughout a patients stay in the **ICU**. The event log user interface provides caregivers with a snapshot view of all salient events...

...per minute. In contrast, patients with known coronary I I artery disease in a surgical **ICU** have alarms set to detect either an absolute heart rate of 95 beats per minute...data output system 656. The procedural note is then printed on the printer in the **ICU** 658 and is exported in HL7 language to the **hospital** data system 660. In addition, this also triggers a billing event and the data output...
...of practice standards can be accessed at the command center/remote location or at the **ICU** to assist in the treatment of the patient. Thus, the general categories of cardiovascular, endocrinology...

AB- <NV> NOVELTY - The memory control system has a storage device comprising a working memory used in connection with an **expert system**. The data potentially relevant to the operation of the **expert system** are filtered by event triggers each comprising a match portion and an action portion.|
AB- <BASIC> DETAILED DESCRIPTION - A processor compares the match portion of at least one of the event triggers to the potentially relevant data, and executes the action portion of any event trigger whose match portion matches the potentially relevant data. The execution of the action portion entails modifying the working memory. INDEPENDENT CLAIMS are also included for the following:
 (a) an **expert system** ;
 (b) a maintaining method of working memory;
 (c) and a system for modifying data stored in a working memory.
USE - For maintaining working memory used in connection with **expert system** for remotely controlling e.g. windows, GUIs, teleconferencing services and monitoring. For pre-filtering data and storing data for more efficient implementation in **expert system**.
ADVANTAGE - Raises efficiency of **expert system** by maintaining a working memory storing only relevant data.
DESCRIPTION OF DRAWING(S) - The figure shows a functional block diagram of an **expert system**.

AB- <NV> NOVELTY - Visual field tests are interpreted by at least three

practitioners licensed to perform visual field test interpretation.

Results of the interpretations of the visual field test codification

provide a set of interpretive rules to establish a protocol for

interpreting visual field test results.

AB- <BASIC> DETAILED DESCRIPTION - A computer is programmed to perform the
protocol of a visual field test on a visual field analyzer for
diagnosis of a patient and interpretation of results of the diagnostic
visual field test by the computer performing the protocol. An
INDEPENDENT CLAIM is included for:

(a) a system for diagnosing a visual disorder in patient
USE - For gathering and interpreting data on a visual field of a

patient, and making clinical diagnoses.

ADVANTAGE - The use of this rule-based **expert system** allows
visual performance monitoring and auto-interpretation with greatly
increased accuracy. By incorporating the **tele-medicine** component of
this invention, visual field performance and auto-interpretation can
readily become a reality on a world-wide basis.
